

A Social Credit Primer on Unemployment

Did you know?

- a modern, industrialized country can produce everything consumers can profitably use without calling on the full capacity of the available workforce
- the ability to satisfy physical demand while relying on less and less human labour is due to the introduction and continual advancement of power-driven machinery, automation, artificial intelligence, and telecommunications in the process of production
- unemployment and under-employment are therefore *natural* consequences of industrial progress
- however, under the current financial system, unemployment becomes a problem because most of the people who do not work either have no income or have to depend on government relief
- the correct solution to this artificial problem of unemployment is not to distribute more work by “creating new jobs”, but rather to distribute more purchasing power in the form of a debt-free National Dividend to all individuals
